All were prepared as follows:

All lipophilic ingredients, lamellar structurants, cocamide MEA, and lamellar stabilizer (if using) were mixed at 150-180°F, setting aside 5-7% of the triglyceride oil or mineral oil. At this point the heating is turned off. This was followed by the addition of the glycerin, then about 1/3 of the remaining water, then the anionic surfactants, the amphoteric/zwitterionics, then the rest of the water. Isopropyl palmitate is added next, followed by the addition of a slurry made of the cationic polymer with the reserved oil. Once the mixture reaches 120°F, the preservatives are added, and once it cools to 100°F, the dyes (if using) and fragrance are added.

Add initial water charge and heat to 150F-160F	Add initial water charge and heat to 150F-160F	Add initial water charge and heat to 150F-160F
Add anionic surfactant	Premix cationic polymer with Propylene glycol and add to main batch	Premix cationic polymer with Isopropyl Palmitate and add to main batch
Add amphoteric surfactant	Mix 15 minutes	Mix 15 minutes
Add Isopropyl Palmitate	Add amphoteric surfactant	Add anionic surfactant
Mix 15 minutes	Add anionic surfactant	Add amphoteric surfactant
Add PEG-120 Methyl Glucose Dioleate	Add other ingredients such as PEG-150 Distearate, Cocamide-MEA, Hydrolyzed Wheat Protein, Glycerin, or Isopropyl Palmitate	Add PEG-120 Methyl Glucose Dioleate
Maintain heat and mix for 30 minutes	Add Glyceryl Laurate or other low molecular weight polymer	Maintain heat and mix for 30 minutes
Begin to cool to 95F	Maintain heat and mix for 30 minutes	Begin to cool to 95F
Premix Fragrance and PEG-40 Hydrogenated Castor Oil and add to main batch at 110F	Begin to cool to 95F	Premix Fragrance and PEG-40 Hydrogenated Castor Oil and add to main batch at 110F
Add preservatives, color, and promotionals below 110F	Premix Fragrance and PEG-40 Hydrogenated Castor Oil and add to main batch at 110F	Add preservatives, color, and promotionals below 110F
Add citric acid to adjust pH to a target range of 5.5-6.0	Add preservatives, color, and promotionals below 110F	Add citric acid to adjust pH to a target range of 5.5-6.0
Mix for 15 minutes and measure final viscosity	Add citric acid to adjust pH to a target range of 6.0-6.5	Mix for 15 minutes and measure final viscosity
	Mix for 15 minutes and measure final viscosity	

Process 7	Process 8	Process 9
Add initial water charge and heat to 150F-160F	Add initial water charge and heat to 150F-160F	Add initial water charge and heat to 150F-160F
Add Acrylates Copolymer	Add first anionic surfactant	Premix cationic polymer with Propylene glycol and add to main batch
Add anionic surfactant	Add second anionic surfactant	Mix 15 minutes
Add amphoteric surfactant	Add amphoteric surfactant	Add amphoteric surfactant
Premix cationic polymer with Isopropyl Palmitate and add to main batch	Add cationic polymer	Add low molecular weight polymer
Mix 15 minutes	Add Glyceryl Laurate or other low molecular weight polymer	Add anionic surfactant
Add other ingredients such as PEG-150 Distearate, Glycerin, and Cocamide-MEA	Add Sodium Cocoyl Glutamate	Add other ingredients such as PEG-150 Distearate, Cocamide-MEA, Hydrolyzed Wheat Protein, Glycerin, or Isopropyl Palmitate
Maintain heat and mix for 30 minutes	Add Cocamide-MEA	Add PEG-120 Methyl Glucose Dioleate
Begin to cool to 95F	Begin to cool to 95F	Maintain heat and mix for 30 minutes
Premix Fragrance and PEG-40 Hydrogenated Castor Oil and add to main batch at 110F	Add preservatives, color, fragrance, and promotionals below 110F	Begin to cool to 95F
Add preservatives, color, and promotionals below 110F	Add citric acid to adjust pH to a target of 6.4	Premix Fragrance and PEG-40 Hydrogenated Castor Oil and add to main batch at 110F
Add citric acid to adjust pH to a target range of 5.5-6.0	Mix for 15 minutes and measure final viscosity	Add preservatives, color, and promotionals below 110F
Mix for 15 minutes and measure final viscosity		Add citric acid to adjust pH to a target range of 5.5-6.0
		Mix for 15 minutes and measure final viscosity
